THE GAME BOY ENCYCLOPEDIA

Nintendo *GAME BOY*™

GAME BOY[®]

DaddaRuleKonge

This book is made for people who collect for or are interested in the original Game Boy (including Game Boy Pocket and Game Boy Light. I made this book cause` I like to catalog and categorize stuff, and to learn more about the system. I also really like the Game Boy.

I have tried to make the book well presented and easy to look through. If you are happy with the book then please look at some of the web-sites on the “Reference Guide” page. Find a site that you like and give them some spending money.

If you are annoyed, or the owner of some of the content i took from you, send an email to me: sennep@hotmail.com. The book is free, and I hope the information and pictures I use comes under free-use.

I hope you will get some use of this book, and maybe help you in your quest on collecting, or just having fun with this great system.

Similar books/PDF`s in the same format are books on NES, SNES, PSX, Sega, Atari, N64, Game&Watch, NeoGeo, including several other book in the same vein, from TMNT toys to Point and Click games.

Game Boy

This is a short wikipedia introduction for the Game Boy.

Nintendo's Game Boy handheld was first released in 1989. The gaming device was the brainchild of long-time Nintendo employee Gunpei Yokoi, who was the person behind the Ultra Hand, an expanding arm toy created and produced by Nintendo in 1970, long before Nintendo would enter the video game market. Yokoi was also responsible for the Game & Watch series of handhelds when Nintendo made the move from toys to video games.

When Yokoi designed the original Game Boy, he knew that to be successful, the system needed to be small, light, inexpensive, and durable, as well as have a varied, recognizable library of games upon its release. By following this simple mantra, the Game Boy line managed to gain a vast following despite technically superior alternatives which would have color graphics instead. This is also apparent in the name (conceived by Shigesato Itoi), which connotes a smaller "sidekick" companion to Nintendo's consoles.

The original gray Game Boy was first released in Japan on April 21, 1989. Based on a Z80 processor, it has a black and green reflective LCD screen, an eight-way directional pad, two action buttons (A and B), and Start and Select buttons. It plays games from ROM-based media contained in small plastic detachable units called cartridges (sometimes called carts or Game Paks).

As part of the fourth generation of gaming, the Game Boy competed with the Sega Game Gear, Atari Lynx, and the TurboExpress. Despite these other handheld consoles, the Game Boy was a tremendous success. The Game Boy and its successor, the Game Boy Color, have both combined sold 118.69 million units worldwide. Upon its release in the United States, it sold its entire shipment of one million units within a few weeks.

The game that pushed the Game Boy into the upper reaches of success was Tetris. Tetris was widely popular, and on the handheld format could be played anywhere. It came packaged with the Game Boy, and broadened its reach; adults and children alike were buying Game Boys in order to play Tetris. Releasing Tetris on the Game Boy was selected as #4 on GameSpy's "25 Smartest Moments in Gaming".

The original Game Boy was one of the first cartridge-based systems that supported more than four players at one time (via the link port). In fact, it has been shown that the system could support 16 simultaneous players. However, this feature was only supported in Faceball 2000.

Game Boy continues its success to this day and many at Nintendo have dedicated the handheld in Yokoi's memory. Game Boy celebrated its 15th anniversary in 2004, which nearly coincided with the 20-year anniversary of the original Nintendo Entertainment System (NES). To celebrate, Nintendo released the Classic NES Series and an NES controller-themed color scheme for the Game Boy Advance SP.

In 2006, Nintendo president Satoru Iwata said on the rumored demise of the Game Boy brand: "No, it's not true after all. What we are repeatedly saying is that for whichever platform, we are always conducting research and development for the new system, be it the Game Boy, or new console or whatever. And what we just told the reporter was that in thinking about the current situation where we are enjoying great sales with the DS and that we are now trying to launch the Wii, it's unthinkable for us to launch any new platform for the handheld system, including the new version of the GBA... Perhaps they misunderstood a part of this story, but as far as the handheld market is concerned [right now] we really want to focus on more sales of the DS; that's all."

In 2009, the Game Boy was inducted into the National Toy Hall of Fame, 20 years after its introduction. As of June 6, 2011, Game Boy and Game Boy Color games are available on the Virtual Console service on the Nintendo 3DS's Nintendo eShop.

Game Boy Games

This is the main portion of the book. A collection of every official GB game with cover art, title screen, a screen-shot and some information about the game. Some games are missing from the pages (as is the case of the four variation release of We're Back!. In North-America the game was released as a movie tie-in with We're Back!. In Australia, the game was called Agro Soar. And in Europe the game was released as both Bamse and Baby T-Rex). If games only had minor differences in release I would count those games as one.

Page Break-Down

This is a break-down on what the pages consist of:

A. Cover-Art

This represent the cover art of the game. I used GameFAQs for much of these pictures. If the game did get a North-American release I would choose the North-American cover over the European or Japanese. If the game only had a Japanese and European release, then a European cover would be present. The Japanese cover is only present if this was the only release of the game.

B. Info

This is the Info box. I used mainly wikipedia for help for information on the Developers and Publishers. I suspect some of the information is wrong, as often the developer credited is actually the makers of the original game, e.g. arcades or original console release, and not the one who did the Game Boy port for example. In the info or trivia section, I wanted some content that would reflect on what the game is about, or an interesting part of trivia. If I used another site for information and did a direct transcript, I would try to credit the source material. The credit is in *italic*.

C. Title Screen

This is a screenshot from the title screen of the game, found wherever. More often then not on gametrailers.com. If the game had Super Game Boy features I would use a color screen-shot.

D. Screen-shot

This is a random screenshot from the game. I mainly used gametrailers.com. I only use black and white screenshots because I would like it to reflect the games origin. Even though the original Game Boy does not feature black and white, but a more yellowish pea soup color.

E. Web Reviews

The review score SHOULD and MUST be taken with a grain of salt. I used the review score from “GameFAQs.com”, cause` they can often be seen as fair, as they usually are reviewed by several users. Though, some of the more obscure games often had few reviews, and could be seen as biased. If the site did not have a review, i would not include one, as seen on the many unlicensed games.

F. Rarity

In this section I used the rarity score found on nintendoage.com. The rarity scale goes from 1 (common) to 10 (rare). The nintendoage has a very good NES rarity section were they cover, if not all, but most of the NES games. Their Game Boy section is lacking though in games covered. About 20% of the North American Game Boy games are missing from the rarity scale, and no European and Japanese games are included. As such, the rarity section are lacking a bit in this book, but I found Nintendoage was the best place to gather rarity scores from. Remember, you should just take these scores with a grain of salt, and should only be used as a refrence point, and not to be taken all too literally.

G. Release

These indicate what type of release the game has. “J” Japan, “N” North-America and “P” PAL/Europe. As with the game Baseball featured here, it had a world wide release. Which is why every letter is present.

H. Super Game Boy

If a game feature some sort of Super Game Boy features, the Super Game Boy logo will be present. But I also included the logo if the logo was present on the box-art, even though it has no Super Game Boy features. For a complete list of Super Game Boy games and their feaitres, look at the Super Game Boy pages.

I. Multiplayer

If they game feature link cable functionality, the Game Link logo would be present.

Game Paks

Each video game is stored on a plastic cartridge, officially called a “Game Pak” by Nintendo. The cartridge provides the code and game data to the console’s CPU. Some cartridges include a small battery with SRAM, flash memory chip, or EEPROM, which allows game data to be saved when the console is turned off. If the battery runs out in a cartridge, then the save data will be lost, however, it is possible to replace the battery with a new battery. To do this, the cartridge must be unscrewed, opened up, and the old battery would be removed and replaced. This may require desoldering the dead battery and soldering the replacement in place. Before 2003, Nintendo used round, flat watch batteries for saving information on the cartridges. These batteries were replaced in newer cartridges because they could only live for a certain amount of time.

Excluding game-specific variations, there are four types of cartridges compatible with Game Boy systems: class A-B-C-D. The original Game Boy games are class A. Class B are Games for the Game Boy Color and Game Boy. Class C is Game Boy Color. And Class D is Game Boy Advance.

Grey cartridges

(Also known as class A) are compatible with all Game Boy systems, excluding Game Boy Micro. All original Game Boy games are of this type. Some of these cartridges are in alternative colors, such as red or blue for Pokémon Red and Blue, and yellow for the Donkey Kong Land series. The games on these cartridges are programmed in black and white; the Game Boy Color and later systems provide selectable color pal-ettes for them. Some grey cartridges that were released between 1994 and 1998 have Super Game Boy enhancements. Even fewer grey cartridges were released with built-in features that made them protrude from the slot, but included the notch to be compatible with the original Game Boy (notably the Game Boy Camera)

Aa Harimanada is based off of a famous manga/anime, with three different versions on three different platforms; GameBoy, GameGear and MegaDrive.

What is most surprising is that the Game Boy version plays completely differently from its 16-bit counterpart. Whereas the Genesis game is fighter flavored, on Nintendo's handheld it's a standard sumo wrestling game. Gameplay is conventional for the genre.

The Bugs Bunny Crazy Castle 2, known in Japan as Mickey Mouse II and known in Europe either as Hugo or simply Mickey Mouse, is the sequel to The Bugs Bunny Crazy Castle.

Bugs Bunny must save his girlfriend Honey Bunny from Witch Hazel's enemy-filled castle. There are 28 levels with keys to collect.

IT'S 2 EXCITING 2 MISS.

It's twice the fun. Twice the thrills.
 Twice the craziness. That's right, it's
 The Bugs Bunny Crazy Castle 2.
 But Bugs isn't getting the royal
 treatment. This "looney" new
 adventure on the Nintendo®
 Game Boy® has Bugs being
 chased by the whole

Looney Tunes gang.
 The Tasmanian Devil,
 Yosemite Sam, Wile E.

Coyote and other crafty characters.
 There are 28 huge and multi-level
 rooms. Giant catapults. Invisible traps.
 Awesome sound. More than enough
 to keep you and Bugs hopping. Will

Bugs succeed in his
 crazy attempts to res-
 cue Honey Bunny? If
 you're a Game Boy®
 player, that's up to
 you. Their future is
 in your hands. So the
 sooner you start the better.

The Bugs Bunny Crazy Castle 2.
 Even better the second time around.

Dragon Slayer I

Developer Falcom
Publisher Epoch
Release date (jp) August 12, 1990
Genre Action role-playing

Dragon Slayer, originally released in 1984 for the PC-8801, etc., is commonly considered one of the progenitors of the action RPG genre. The premise is similar to Roguelikes: the player takes control of a knight who must fight his way through large overhead maze-like dungeons. Unlike roguelikes, the combat in the game is fully action-oriented: the player must approach the monster and “bump” into it in order to inflict damage, at the same time trying to avoid its blows.

Cooking Densetsu is a cooking based RPG for the GameBoy. It's a short and simple game with a fun premise. Battles are done quiz-style, so if players don't speak Japanese they will struggle with that aspect a bit. The overall difficulty is very low, especially since some of the recipes (spells) will basically give players infinite HP, and some battle options will tell them the correct answers to the quiz questions.

Release date (jp) December 7, 1990
Genre Strategy

NavyBlue '90, just like its predecessor, uses the classic Battleship playing principle: two players place ships on a 8x8 grid and then, in turns, guess a position on the opponent's grid. The goal is to hit all ship parts first. There are a few extra weapons available which allow to scout enemy grids or hit multiple grids at once.

The main difference to the predecessor is that players have to choose their equipment before the match starts: three ships and which/how many extra weapons.

As a alchemist players must solve a set of mazes to prove their worth. To solve the mazes they must transform the items which are found in the maze into something more useful. For example, a piece of iron turns in a glass key when dropped in a pool of fire. Thus, if players want to pass a glass door, they have to find a pool of fire and a piece of iron. These transformations are not random, but sometimes require multiple stages. If they keep good notes, they'll find out all possible transformations.

Red and Blue are mostly identical. The most apparent difference are the five-six exclusive Pokémon found only on the different version of each game. Splitting the game into two versions apparently came from the game designer, Satoshi Tajiri, long-time friend, role model, mentor, and fellow Nintendo developer; Shigeru Miyamoto. Miyamoto suggested creating multiple cartridges with different Pokémon in each, noting it would assist the trading aspect.

Race Days is a 1994 racing video game for the Game Boy, which is essentially a compilation of the video games Dirty Racing (Japan-exclusive) and Jeep Jambo: Off Road Adventure (North America-exclusive); albeit with a different name for the Jeep Jambo game.

GamePro’s review criticized the game as having boring tracks, drab graphics, irritatingly droning engine sounds, difficult controls, and poor gameplay design.

Racing Damashii is a motorcycle racing game with six courses. It is basically action-oriented, but the player needs to watch the damage of the motorcycle (decreases with crashes) and the tire condition (decreases when leaving the road). If one of the two bars runs out, the race is over, but repairs are conducted during pit stops. The two playing modes for single-player are training races and a championship in which points are awarded for good end positions. Those can be reinvested into motorcycle upgrades.

 Release date (jp) July 13, 1990
 Genre Puzzle

Match Mania is a conversion of the Mahjong solitaire variant Shisen-Sho. The mahjong tiles lie next to each other on a grid field. The goal is to remove all stones, but only two identical tiles can be removed. Since that alone would be too easy, they are viable if they could be connected with up to three horizontal or vertical lines which do not pass through other tiles or over the playfield border. This version features a normal mode with 50 puzzles and a challenge mode where the player races against the clock.

Genre Action, Strategy

This entry in the game series based on the Spy vs Spy comic strip series has a similar gameplay premise as the other games of the series, but a different set of levels (overall 20) and scenarios. Another apparent difference is the missing split-screen. The player either takes control of the black or white spy who both have the same goal: finding the five hidden items and reach the exit within the time limit.

Release date (jp) December 19, 1997
Genre Puzzle

In this vaguely Tetris-like game, players score points by eliminating "star blocks." A star block is a "colored" rectangle with a star on one end of it, and blocks are eliminated when the stars of two like-colored blocks touch each other. While the game is being played, star blocks and obstacles rise from the bottom of the screen while the player moves and rotates a cursor which determines where additional star blocks will be thrown into play from off-screen.

The player takes the role of Taz who has to free his family which was kidnapped by the two hunters Bull Gator and Ax1. This is basically a standard platformer in which the player crosses the 16 levels, jumps over gaps and dodges enemies. However, the unique feature of the cartoon Taz was converted to the game: his ability to spin. This allows him to reach high acceleration and being invulnerable - but every second takes away a part of the associated energy bar.

Tetris is a portable version of Alexey Pajitnov's original Tetris and it was bundled in the North American and European releases of the Game Boy itself.

The object of the game is to manipulate tetrads, by moving each one sideways and rotating it by 90-degree units, with the aim of creating a horizontal line of blocks without gaps. When one or more such lines are created, they disappear, and the blocks above (if any) move down by the number of lines cleared.

As a variation of the Tetris concept, rather than having the objective of matching horizontal lines of blocks which descend from the top of the screen as tetrominos, instead the player matches the shapes of the descending blocks (which include irregular tetromino shapes) to blocks already fixed on the game board, which causes blocks to disappear from the board when three blocks of the same colour are matched, in a manner similar to the puzzle video game Dr. Mario.

The game was influenced by the Starglider series, and was originally slated to be published by Mindscape as Eclipse or Lunar Chase, but Nintendo took over the project after becoming interested in the concept of having three-dimensional graphics on the Game Boy. Then Nintendo president Hiroshi Yamauchi renamed the game X, shortly before its release. The Japanese magazine Famitsu listed X as one of the four most influential Game Boy games released, as it was the first 3D game released for a portable system in Japan.

Unlicensed Games

These pages include games for the Game Boy that were produced without the permission or knowledge of Nintendo.

For a piece of software to run on a Game Boy, it must contain a copy of Nintendo's logo identical to the one in the console's internal ROM, and that logo will be displayed at startup; this was presumably done for similar reasons as Sega's TMSS, in that it forces any unlicensed producer of cartridges (whether a pirate or an otherwise legitimate unlicensed developer) to include the Nintendo logo in their games, theoretically committing trademark infringement in the process. These measures were particularly aimed at Taiwan, which at the time had no copyright agreement with Japan but did allow Japanese companies to register trademarks; this is why you'll often see Taiwanese pirate games with company and console logos removed but everything else intact. (It's also one of the many reasons NTDEC - Nintendo Electronic Co - ended up with a massive lawsuit from Nintendo, while its competitors mostly escaped.) But, fortunately for unlicensed developers, Sega's TMSS didn't hold up in court (in the US anyway), which may have rendered Nintendo's Game Boy efforts largely pointless too.

Some companies, though, (whether they believed it legally necessary - which it may well have been in some places - or

they just wanted to stick two fingers up to Nintendo) managed to replace Nintendo's logo with their own. This works because the Game Boy reads the logo twice: once to display it, then again to check it against its own stored copy. So the cartridge provides the custom logo for the first check, then Nintendo's for the second. The Game Boy Color performs the check differently, which breaks older mono games using this method (eg Sachen's) but only checks the first half of the logo, hence why you'll sometimes see GBC games that only modify the lower half. Others still managed to replace the whole thing, though.

Now, emulator users will probably be unfamiliar with all these logo shenanigans; the GB's internal ROM was only dumped recently, and even those emulators that do make use of it (such as MESS) don't emulate the hardware trickery employed by these carts to display a custom logo, so you'll only see Nintendo's in any case. But the alternate logo is, usually, still present in the ROM at 0184h (sometimes accompanied by an entire secondary header, sometimes just the logo itself); if you use a hex editor to copy 30h bytes from that location over the real Nintendo logo at 0104, you can see the custom logo in any emulator that would otherwise display Nintendo's.

SACHEN

Sachen, aka Thin Chen Enterprises, seemingly became involved in the development of software for handheld gaming devices during the early 1990s, possibly in 1992. Thin Chen initially ported several of its FamiCom games to the Watara Supervision, an obscure handheld machine, which, at the time, had been hyped up to be a major competitor to Nintendo's highly-popular Game Boy. In addition to the ports from its FamiCom library, Thin Chen would also design a few new titles, which would be released on the Supervision.

By 1993, Sachen would branch out and develop games for several other portable gaming machines, including the Mega Duck and its equally obscure cousin, the Cougar Boy. It was during this time that Sachen would also begin developing games for the

Game Boy, which were advertised under Sachen's alias, Commin.

During this time period, roughly forty different Game Boy games would be developed. Most of these games are strikingly similar to their counterparts for the Mega Duck/Cougar Boy machines, though the MD/CB games are not physically compatible with the GB, and vice versa. Which release came first is anyone's guess, and they could have been compatible with each other on a programming level, thus being developed and subsequently hacked or something along that lines.

The original Sachen Game Boy games were released on 4 in 1 multicarts for the black and white Game Boy machine, and were released in different boxes. These cartridges were exported across the globe, and

each pack included an English manual, as well as a localized manual in a variety of languages, such as German and Portuguese. Some of the 4 in 1 game packs were also published in Germany and distributed there by Nic Nac Electronic-Land. These cartridges are housed within special cardboard boxes, containing German text.

During the first few years in the 21st century, Sachen was still around, cranking out new game products. During this time they released several new Game Boy games, including Beast Fighter, Street Hero, Thunder Blast Man (aka Rocman X), Jurassic Boy 2, and 2002 Gedou Zhanlue, which would be their final game release. These games would be released for the Game Boy Color, though most of them are backwards compatible with the Game Boy.

Besides these 4 in 1 multicarts, Sachen would also try to squeeze even more money out of their cash cow by releasing a variety of other Game Boy Color multicarts, which all contain the same material as can be found on the originals. For example, Sachen teamed up with Home Entertainment Suppliers, and released four different 8 in 1 game packs for the Game Boy, which each combine the games from two of the four in one packs. Some of these carts eventually made it for sale in Germany, with German manuals.

Super Mario 4 (aka Super Mario Land 4) is a hack of the Game Boy game Crayon Shin Chan 4, originally by Bandai. It is a very common title on multicarts, and can be difficult to obtain in stand-alone form.

The new level design is very challenging, and sometimes unfair; the game now includes many blind jumps and areas that require Mario to take damage in order to progress, making for a rather frustrating experience.

Multicarts

Multicarts are usually a single game cartridge that has more than one game on it. Since they are very easy to make, a lot of them are made by various pirate companies. They are most commonly found for the NES/FamiCom, but they have been produced for many popular cartridge-based consoles, including the Game Boy. Almost all multicarts released on the Game Boy are unlicensed.

The general multicart has a whole bunch of pictures crammed onto the cartridge's art. Sometimes the pictures are from a more recent game (or possibly an unrelated film), or the official art has been edited. Misspellings of the game names on the cartridge and/or menu. A list on the cart (usually on the back if it's a large number of games) listing the game names in English and/or Chinese.

Many multicarts have an unusually high number like 200-in-1, 777-in-1, or even 99999999-in-1. The carts typically don't hold up their promise, meaning the last few games could be duplicates of the originals.

Most of them use a menu system, although multicarts containing 4 games or less (sometimes considerably more for Game Boy multicarts) are sometimes reset based.

Most of the time, the lower the number of games listed, the better the cart is. Lower ones like 4-in-1 usually contain a rare game or a game made or published by the company that made it.

Some larger Game Boy multicarts are twice as tall as standard carts to accommodate the extra games.

Some Game Boy multicarts don't have a boot-up menu at all, and instead, employ a physical button on the cartridge itself which resets the system and cycles to the next one on the cartridge.

By: bootleggames.wikia.com

These multicarts was released in huge quantites and is easily found on flea markets and auction sites on-line for a few bucks. None of these multicarts usually holds any value.

EverDrive-GB

By: [Cauterize@RetroCollect.com](#)

The Everdrive GB is an incredibly late arrival by hardware standards, as Game Boy flash cartridges themselves have been around for as long as the Game Boy itself. During the nineties, devices such as the Bung XChanger and Doctor GB were readily available via importing from

the Far East, allowing those with a parallel port enabled computer to transfer a selection of games onto cartridge.

Fast forward to today and there are also a range of modern alternatives available. The Drag N Derp cartridge serves as an easy USB ready removable drive which can store a single game for use in a Game Boy. There's also the USB Smart Card 64M, the latest import from abroad which if anything is an updated version of the cartridges available several decades ago.

All things considered though, the market for Game Boy flash cartridges has changed overnight. The Everdrive GB has pretty much rendered all other solutions obsolete by fixing all the problems they presented, and more.

Arriving in a sleek clear Color-style case with a snazzy custom label, the Everdrive GB weighs in at a mere 22g and slots into any Game Boy system around - including the later Game Boy Advance units. Although many of the later clear cased Color games were incompatible with the original Game Boy, the Everdrive GB's case has a small cut out of its top right reverse corner to allow the original system's power switch room to turn on.

Looking elsewhere and through the clear case, you'll also spot the device's SD Card slot near the top of the chipboard - with an accompanying hole cut out of the case above for the easy removal/insertion of memory cards. This slot is only compatible with MicroSD cards, however, it can read up to 32gb worth of storage space - something we'd be incredibly surprised if anyone managed to use anything near that amount.

Upon booting the cartridge up on the Nintendo Game Boy, you'll be greeted with a simple filebrowser displaying a list of what you've placed onto your MicroSD card. From here, a press of a button will have the selected game ROM written to memory and then

booted up as if the original game was present.

If you already own an Everdrive cartridge for the likes of the Sega Mega Drive or SNES, you'll no doubt already be familiar with the benefits of owning such a device. The ease of use an Everdrive provides is incredible, as your existing collection of cartridges will soon end up becoming display items.

To put this into perspective, theoretically, given the size of game ROM files and the current capacity of MicroSD cards, it is possible to cram every single Nintendo Game Boy game ever made onto this one device.

Out of the box the Everdrive GB offers near perfect compatibility with the existing library of titles, including all the greats. Using the aforementioned menu, you'll be able to load up titles such as Pokemon Red/Blue, Super Mario Land, Donkey Kong and even Zelda: Link's Awakening, all flawlessly. If that wasn't enough already, these games will then also behave exactly as their physical counterparts would.

Functionality for multiple save game files is present - something prior flash cartridges struggled with - as the Everdrive GB writes the SRAM down into individual files for each game. This means that should you switch over to another game, the data from the last game you played will be safely stored on the SD Card. What makes this even better is that the standard used here is compatible with emulators. So should you already be halfway through a quest using emulators, or want to take your progress off the Everdrive GB and continue elsewhere, it's a simple case of copying your save game from the SD card and placing it wherever needed (and vice versa).

Although a lot of the terminology used here in this review relates to the classic Nintendo Game Boy, the Everdrive GB is in fact compatible with a range of devices. First and foremost, the cartridge not only works with a Game Boy Color, but also Game Boy Color game ROMs too. The likes of Tetris DX, Pokemon Gold / Silver, Super Mario Bros Deluxe and Dragon Warrior Monsters are all playable, and work exactly as you'd expect them to.

At just £64.99 - a price you could argue is equivalent to a mere fifteen Game Boy originals - you'll have access to the entire library of 8-bit portable titles, along with the many more in development and array of ROM hacks.

Please visit retrocollect.com for the whole review.

System Packages

These pages include some of the different packages and color variants the N64 went through.

The first Game Boy was released in 1989. It was large and gray, with a monochrome dot matrix screen and monaural sound. It was playable for an average of 35 hours with four AA batteries. The original Game Boy was later known as the “Off-white” or “Original Grey” version.

Listed here are a few of the different package versions the original Game Boy came in.

GAME BOY PLAY IT LOUD! SERIES

On January 1, 1995, Nintendo released several Game Boy models with colored cases, advertising them in the “Play It Loud!” campaign. Specifications for this unit remain exactly the same as the original Game Boy, including the monochromatic screen. This new line of colored Game Boys would set a precedent for later Nintendo handhelds; every one of them since has been available in more than one color. Play It Loud! units were manufactured in red, green, black, yellow, white, blue, and clear (transparent) or sometimes called X-Ray in the UK. Most common are the yellow, red, clear and black, Green is fairly scarce but blue and white are the rarest. Blue was a Europe and Japan only release, White was a Japanese majority release with UK Toys R Us stores also getting it as an exclusive edition to them. The white remains the rarest of all the Play it Loud colors.

Limited Editions / Promos / Prizes

Like the Game&Watch line, the Game Boy had a range of different limited editions. Ranging from official Nintendo releases, licensed releases to unlicensed releases. These pages include, probably not all, but a good portion of the limited editions the Game Boy had.

The pictures of the boxes may be false as some of the pictures I found are from collectors who could have just got a loose limited edition Game Boy and just put it in an empty standard box. If I did not find a picture with a box beside it, I would leave the area blank.

A lot of the information on these pages comes from the website consolevariations.com. If you want more information on other consoles, then please visit the site. It has pictures from a huge line of systems, including; Nintendo, Atari, Sony, Microsoft, and Sega.

Manchester United FC

This is the only Game Boy to prominently display a demon on the front. The Game Boy had a U.K. only release and was released alongside the other colors as part of Nintendo's "Play It Loud!" ad campaign.

Buyers can still find these, new, for around \$200 and loose for half that. They aren't that rare in the UK.

Planet Hollywood

Planet Hollywood is a restaurant that was fairly popular back in the early to late 90's. They managed a deal with Nintendo to get Planet Hollywood-branded Game Boys. They were sold in the gift shop of the restaurant and were rumored to be a U.K.-exclusive.

Occasionally they show up on eBay and would probably fetch around \$200.

<3

This Game Boy is a game show prize. It is missing the "Nintendo GAME BOY" printed on the front but it was professionally painted and a serial number was added on after the paint job.

Santa Clara Division

The Santa Clara Division is a Off-White Game Boy with the black Santa Clara logo, released in a limited quantity of 50 pieces.

Not much information is known about this release.

Vivitar PMA '93

It seems pretty clear that this was probably a Vivitar employee gift or something from the PMA (Photo Marketing Association) Conference in 1993. The mark is printed in the same manner and in the exact same purple color as other text on the front of the GB.

Kirin Beverage

The Kirin Beverage is an Off-White Game Boy with the red Kirin Beverage logo.

Not much information known about this release.

Kirin Brewery sells two of the most popular beers in Japan: Kirin Lager, one of the country's oldest beer brands which started brewing in 1888; and Ichiban Shibori.

Mini Comboy

The Japanese and the Koreans have a somewhat tense relationship. When the Koreans were freed from Japanese rule after World War II there was a ban on Japanese cultural imports. Not wanting to lose profit, Nintendo licensed the Game Boy through Hyundai and sold it under the name Mini Comboy. Sega was licensend under Samsung and called the Genesis, "Samsung Super Gam*Boy" initially, and then renamed to "Samsung Super Aladdin Boy".

Iveco/Ford

The Iveco/Ford gameboy was made for a competition giveaway in the U.K. by a trucking magazine, Commercial Motors.

There probably was 100 made for the competition. It is not considered an official release. The first prize was to drive the Big Ford Cargo 7.5 tonner for a year

Toyota

Buy a car, get a Game Boy. This was a sales strategy in Japan employed by Toyota in 1992.

It is worth around \$200 but they are very hard to find, especially anywhere but Japan.

Kirby Pinball

The Game Boy was part of mail in sweepstakes for a UK company called, The Jacob's Bakery Limited, and only 25 were given out.

The Game Boy came in a regular box with a "limited edition" sticker.

Wario

The Game Boy is missing the typical "Nintendo GAME BOY" printed on the front. This was a prize given away in the UK from the show Ghost Train in the early 90's.

Details are scarce, but a reader won this black-painted (not black plastic) Game Boy in a U.K. radio competition. It has a white-outline picture of Wario below the screen, and came in a regular box with a "limited edition" sticker.

JAL

The JAL version, a Off-White Game Boy with a “JAL” logo, was only released in Japan. “JAL” stands for Japanese Airlines.

The console has its own serial number. It begins with a “JALXXXX”

“consolevariations.com”

Bee Ind

The Game Boy Bee Ind is an off-white Game Boy with Bee Ind logo. The console was only released in Japan with a limited quantity of 50 pieces.

Not much is known about this version.

Altus Newing

This limited white version was released in Japan in a limited quantity of 50 pieces.

Altus Newing is a Japanese manufacturer for GOLF equipments. The Console was a prize back in the 90s in Japan.

Electronic Boutique

The Game Boy Electronic Boutique was only released in United Kingdom and sold in the EB uk stores. The Game Boy came in a package with the game Killer Instinct.

Only 350 versions were made.

Serebrov Anniversary

In 1993 the Russian astronaut Aleksandr A. Serebrov traveled to the MIR space station, bringing with him a Game Boy that accompanied him the 196 days he spent there. In the 10th anniversary, the Memorial Museum of Cosmonautics in Moscow released classic Game Boys with a sticker that represented the emblem of the Soyuz mission that performed the assembly.

"Game Boy Generations Book"

Milka

The Milka Game Boy sports a tiny, purple, Milka-branded cow on a green pasture and was a contest prize in Germany.

There are rumored to be only 50 of these in existence and they sell for more than \$230.

FIAT

This console was released as a contest prize in North America with a limited quantity of 100 pieces.

The console is a Deep-black Game Boy with the logo of FIAT on it.

"consolevariations.com"

Caixa Edition

According to consolevariations.com, a "Caixa" Game Boy was released in Brazil. The console is a Off-White Game Boy that has a flower logo on it's back. I could not find any pictures of the Game Boy.

Game Boy Pocket

In 1996, Nintendo released the Game Boy Pocket: a smaller, lighter unit that required fewer batteries. It has space for two AAA batteries, which provide approximately 10 hours of game play. Additionally the unit is also fitted with a 3 volt, 2.35mm x 0.75mm DC jack which can be used to power the system. The Pocket has a smaller link port, which requires an adapter to link with the older Game Boy. The port design is used on all subsequent Game Boy models, excluding the Game Boy Micro. The screen was changed to a true black-and-white display, rather than the “pea soup” monochromatic display of the original Game Boy. Also, the Game Boy Pocket (GBP) has a larger screen than the Game Boy Color (GBC) that later superseded it. The GBP’s screen has a 65 mm (2.56

in) diagonal, 48.5 mm (1.91 in) width, and 43.5 mm (1.71 in) height, compared to a 59 mm (2.32 in) diagonal for the GBC. Although, like its predecessor, the Game Boy Pocket has no backlight to allow play in a darkened area, it did notably improve visibility and pixel response-time (virtually eliminating video ghosting). The first version did not have a power LED. This was soon added due to public demand, along with new Game Boy Pocket units of different colors (released on April 28, 1997), some of them new to the Game Boy line. There were several limited-edition Game Boy Pockets including a metallic Ice Blue unit and a pink model exclusive to Japan. The Game Boy Pocket was not a new software platform and played the same software as the original Game Boy model.

Game Boy Pocket Sonar

The Game Boy Pocket Sonar is a peripheral for the Nintendo Game Boy made by Bandai that used sonar to locate fish up to 20 meters (65 feet) underwater for the sport of fishing and contained a fishing mini-game. It was released in Japan in 1998, but never internationally. It holds the record for being the first sonar-enabled gaming accessory.

Game Link Cable

The first generation Game Link Cable (model DMG-04) was released alongside the original Game Boy and has “large” connectors on both ends. It can only be used to link two original Game Boys to play Game Link-compatible games, usually denoted by a “Game Link” logo on the packaging and cartridge.

Game Boy battery pack

The Game Boy Battery Pack sold for about \$30 USD. The battery peripheral itself is roughly 3 in. long, 2 in. wide, and 0.5 in. thick. One end sprouts a thin cable that ends by being plugged into the external power jack of the Game Boy, while the other end connects to a standard mains plug. The first version of it is gray with purple lettering, to match the colors used on the Game Boy. It also features a belt clip.

The battery pack was good for several hours of gameplay per charge, providing an alternative to purchasing more AA batteries once their power had exhausted. The product used nickel-cadmium batteries, lasted about 4–5 hours per charge, and could be charged roughly 1000 times before a significant loss in effectiveness. A major drawback of the battery pack is its weight, as well as the way the plug stuck out prominently from the side of the Game Boy.

Game Boy Pocket Charger and Battery Pack

The official Game Boy Pocket Battery Pack is a rechargeable battery which can be used in the Game Boy Color (CGB-001) or Game Boy Pocket (MGB-001) or Game Boy Light (MGB-101). The battery life is about 10 hours in Game Boy Color or Game Boy Light and about 8 hours in Game Boy Pocket.

The Game Boy Pocket Charger is the charger which charges the battery pack (MGB-002). The battery charge time is about 12 hours (when The battery is empty).

The Charger and Battery Pack were released in Japan in July 21, 1996 for ¥3500, or at ¥1,900 for the Battery Pack only).

Game Link Cable Adaptor

After the release of the Game Boy Pocket, Nintendo started using a smaller Game Link connector and released an adaptor called the Game Link Cable Adaptor (MGB-004) which could be used in conjunction with the original Game Link cable (DMG-04) to allow an original Game Boy to connect to a Game Boy Pocket/Color.

Game Boy Four Player Adapter

A select few Game Boy games, such as F-1 Race, supported multiplayer modes for up to four players, although this requires the use of up to three additional Game Link cables and the Game Boy Four Player Adapter (model DMG-07).

Game Boy Pocket Game Link Cable

The second generation started with the release of the Game Boy Pocket which used a much smaller Game Link connector than those used on the original Game Boy. Although the pin assignment and basic port shape remained the same, its much smaller size necessitated the release of new Game Link Cables.

The second generation Game Link Cables came in a few varieties, but each serves the same purpose. The first was called the Game Boy Pocket Game Link Cable (MGB-008), and was designed to be used with the Game Boy Pocket. The MGB-008 was the only Game Link cable to be white in color, and may have only been released in Japan. The MGB-008 features the smaller second generation connectors on both ends, allowing two Game Boy Pockets to link.

Universal Game Link Cable

The next cable of the second generation is called the Universal Game Link Cable (MGB-010). It features the smaller second generation connector on one end, and the cable splits into both a second generation and first generation connector at the other end (although only one connector at this end can be used at any given time). This link cable was included with the Game Boy Printer in the USA and Europe but does not appear to have been available to buy separately.

After the Game Boy Pocket came the Game Boy Light, and the Game Boy Color, all share the same link cable port design, and Game Boy Color games and original Game Boy games can both use a second generation cable. Therefore, the Game Boy Color is compatible with the MGB-008 and MGB-010.

Cleaning Kit

The official Game Boy Cleaning Kit was released in Japan and has the Nintendo model number DMG-08. The cleaning kit is similar to the NES cleaning kit and is used to clean the systems cartridge port. It includes a cleaning cart and a brush. Users first insert the the cleaning cart then use the brush on the remaining dirt inside the cartridge

Stereo Headphones

The official Nintendo Stereo Headphones was released in most original Game Boy bundles in North America and Europe. It was also possible to buy the headphones separately. In Japan they came at a price of ¥1,000. The headphones have a red and blue tab on them to distinguish from left and right. Other than that, they are very ordinary cheap stereo headphones.

Game Boy Camera

The Game Boy Camera, released as Pocket Camera in Japan, is an official Nintendo accessory for the Game Boy and was released on September 17, 1998 in Japan, which ceased manufacture in late 2002. It is compatible with all of the Game Boy platforms (with the exception of Game Boy Micro). The camera can take 256×224 (down scaled to half resolution on the unit with anti-aliasing), black & white digital images using the 4-color palette of the Game Boy system. It interfaced with the Game Boy Printer, which utilized thermal paper to print any saved images, making a hardcopy. Both the camera and the printer were marketed by Nintendo as light-hearted entertainment devices aimed mainly at children in all three major video game regions of the world: Japan, North America, and Europe. N64 Magazine (which has since been superseded by NGamer) dedicated a monthly section to the device.

The Game Boy Camera comes in five different standard colors: blue, green, red, yellow and clear purple (Japan only). There was also a limited edition gold The Legend of Zelda: Ocarina of Time edition, which contains different stamps from the standard versions and was available only in the United States through a mail order offer from Nintendo Power.

The device's software has numerous references to other Nintendo products. Also, there are a few differences between the North American and Japanese versions, including the unlockable B album pictures and the stamps that can be placed on pictures.

Initially, the Game Boy Camera was not well received at Nintendo. However, Kuwahara approached Creatures, Inc. President Hirokazu Tanaka regarding the development of the software for the device, which solidified the project. The camera's built-in software was co-developed by Nintendo Research & Development 1 and the Japanese company Jupiter, with Tanaka directing the project.

The Game Boy Camera was featured in the 1999 edition of Guinness World Records for being the world's smallest digital camera, though this record has since been broken. Nintendo reportedly had plans to release a successor to the Game Boy Camera for the Game Boy Advance called the GameEye which would take color photos and feature connectivity with the Nintendo GameCube through a game titled Stage Debut, but neither the GameEye nor Stage Debut ever saw release.

The Game Boy Camera was used to take the photographs for the album cover of Neil Young's Silver & Gold. The Game Boy Camera was featured prominently in the Hong Kong zombie film Bio Zombie. In Banjo-Tooie, Chris P. Bacon uses a Game Boy Camera to take pictures.

There are three main options available on the menu screen: Shoot, View, and Play.

Users can make photo albums, slide-shows, and custom animations of photos. Hot-Spot allows users to link pictures together by clicking on certain spots of the picture. This can be used in a number of creative ways. For example, it could be used for creating a game where a player can go from one photo of a room in a house to another by pressing certain spots on the photos. The location of the hot-spots are customizable by accessing the Special menu via the Select options and choosing "Hot-Spot". In this mode, up to five one-eyed blobs can be placed on each picture, which become invisible hot-spots during "Hot-Spot" mode. Each blob can be programmed to send the player to a different photo and include a visual transition and a sound effect. Then, in Hot-Spot mode, when the player presses one of the hot-spots, he or she will be sent to a photo of another room, where additional hot-spots will send the player to additional photos, and move him or her throughout the virtual house.

Game Boy Printer

The Game Boy Printer, known in Japan as the Pocket Printer, is a thermal printer accessory released by Nintendo in 1998, which ceased manufacture in early 2003. The Game Boy Printer is compatible with all the Game Boy systems except the Game Boy Micro, and is designed to be used in conjunction with the Game Boy Camera. It also prints images from compatible late-generation Game Boy and Game Boy Color games. It runs on six AA batteries and uses a special 3.8 cm wide thermal paper with adhesive backing, sold in white, red, yellow and blue colors. In Japan, a bright yellow Pokémon version of the Game Boy Printer was released, featuring a feed button in the style of a Poké Ball.

Mad Catz sells a kit that enables users to connect a Game Boy to a PC and print images using the PC's printer.

Hobbyists outside the UK can also make their own cable for uploading images to their computer. A Game Boy Printer emulator is needed for the Game Boy to interface with the PC once linked via cable. The Game Boy Printer Paper has also been discontinued, and rolls of the genuine article that still produce a reliable image are becoming more difficult to find. Regular thermal paper, such as the kind used for POS terminals, can be cut to the proper width and used successfully with the Game Boy Printer.

The system will print a test message reading "Hello!" if it is turned on while the feed button is held. According to the manual, this is used to test if the printer is functioning properly. To get around using six AA batteries (1.5 volts each) for the printer, a single 9V battery can be used if wired properly, because the printer requires 9 volts DC.

Game Boy Printer paper

A roll of the American Game Boy Printer paper came in red, blue, yellow and white, with an adhesive backing. It had a width of 38mm and a diameter of 30mm, with a 12mm cardboard spindle in the centre. A typical roll had 390–400 cm of length. When a picture printed from the Game Boy Camera, it would print with a .5 cm margin above and below the picture and print the picture at a 2.3 cm height. This would give the total of 3.3 cm height per picture. The Game Boy Printer paper refills boasted up to 180 pictures per roll. With the math the typical roll could only take 118 pictures. The paper is now hard to find; it could be substituted with a 1.5-inch-wide (38 mm) thermal paper without repercussions on the printer.

Pokémon Pinball has a glitch to where it will only print the RED high scores.

Barcode Boy

The Barcode Boy by Namco is a Game Boy peripheral released only in Japan in December 1992. It attaches to the Game Boy and is used to scan or swipe barcodes, similar to the e-Reader.

Games such as Monster Maker: Barcode Saga were designed to be used

specifically with the Barcode Boy. Scanning the game cards would give the player the ability to customize characters and battle opponents via a link cable. The scanner is also compatible with auto and horse racing games available in Japan. Players of those games search out codes that will give the fastest car or horse.

Other barcodes found on actual store-bought merchandise could be scanned as well, giving the player different features in the games.

The Barcode Boy was featured in an article in Nintendo Power V56 in 1994.

Handy Boy

The Joyplus Handy Boy is an official “all in one accessory” for the original Game Boy. It features two amplified external speakers that are positioned on each side of the screen. The Handy Boy adds a square magnifier which has simple light for illumination. These parts can fold together for travel. Additionally, a thumb joystick can be clipped onto the Game Boy with or without the speakers and magnifier.

Game Genie

This was the first cheat device for the Game Boy manufactured by Galoob. It is designed to nest snugly into the original Game Boy (though it will loosely fit into the Pocket and Color systems; it will fit into the Super Game Boy only if you saw off the plastic clip on the Genie’s bottom.) The cartridge is inserted with the label facing inward. A compartment on the back holds the tiny code book containing codes for the system. Up to three lines of codes can be entered at a time. There is no backup, so codes have to be reentered upon each startup. Nintendo fought this accessory in *Lewis Galoob Toys, Inc. v. Nintendo of America, Inc.*, but the court ruled that the Game Genie did not create a derivative work.

BoosterBoy

In practice, the Game Boy is housed inside this unit, which devours four C batteries at a time. The only visible part of the handheld is the screen, with the peripheral taking over all controls, complete with an analogue stick and shaky buttons. While extra loud speakers and a magnifier may be helpful to some, this

add-on takes a portable console and morphs it into a lump of plastic the size of a 1980s telephone.

Light Boy

One of the first widely distributed experience enhancers for the Game Boy was the Light Boy, a battery-powered attachment that not only lit up the screen with LEDs, but magnified it too. The Light Boy could make late car rides and nighttime gaming sessions doable in an era where backlighting technology simply just did not exist, but with a cost of headache, nausea and blurry vision.

Game Boy Radio

The Gameboy FM Radio by Beeshu is a third party peripheral which turns the original Game Boy into an FM radio. The radio fits into the cartridge port and use the Game Boy only as a power supply.

Nuby Amplifier

The Nuby Amplifier for Game Boy is a micro-amp that gives users greater volume control. The Amplifier fits snugly into the original Game Boy's headphone jack. It features stereo sound, but when the speakers are so close, one cannot get good stereo separation. The speakers sound distorted at higher volumes.

Game Boy Carrying Case

Several carrying cases and traveling bags were released for the Gameboy, both unlicensed and official products. Pictured here are a few of the cases/bags that were released for the system.

Nuby Light

The Nuby is an officially licensed 3rd-party product. It is a window attached to a battery pack. Inside the window are two LEDs, one on each side of the screen. The battery pack takes 4xAA batteries connected in series, not parallel.

The Nuby slides over the Game Boy's screen and is held in place by two ridges at the top of the Game Boy. The fit is tight. The Nuby will not fit over a Game Boy Pocket or Color, Nuby released separate products for those systems. When users turn the switch on, the LEDs bathe the screen in white-yellowish light. The insides of the plastic window use glossy white plastic to give some reflective capability.

The Nuby and its batteries add substantially to the weight of the Game Boy. With the Nuby with its batteries, a Game Boy weighs 17.3oz. Without the Nuby, it Game Boy weighs 12.2oz.

The Nuby's bulk and its cutting off of the screen's edges makes it only useful when the ambient light is insufficient to see the screen. Users can play their Game Boy in the dark with a Nuby, but they may not play as well because of the non-uniform lighting and the glare that tends to obscure each edge of the screen.

Even though the Nuby is not a perfect product, it is still thought by many to be better than its competitors. It is sturdily built, unlike some of the magnifier units sold for the Game Boy. The Nuby's LEDs are extremely close to the Game Boy screen whereas the Light Boy and other magnifier lights are further away, significantly reducing the amount of light hitting the screen.

Nuby also bundled the light with a separately-attached magnifier and called it the Nuby Light Plus. Though, magnifiers tend to make the screen darker and the graphics more pixelated.

Super Game Boy

The Super Game Boy is a 16-bit adapter cartridge for Nintendo's Super Nintendo Entertainment System. It was the first Game Boy-based add-on to a Nintendo console. The Super Game Boy allows game cartridges designed for use on the Game Boy to be played on a TV display using the Super NES controllers. It is the precursor to the Game Boy Player on the Nintendo GameCube, which functions in a similar manner.

The Super Game Boy is compatible with the original monochrome Game Boy cartridges, Game Boy Camera, and the black Game Boy Color cartridges although it would display the latter in their monochrome compatibility mode. The unit could map the four shades of green to various colors on the screen. Later Game Boy games that were optimized to use the Super Game Boy had additional color information and could over-ride the ability to change the on-screen colors, and the ability to display a graphical border around the screen as well as the ability to display special background sprites on the screen, as seen in the Mario's Picross title screen. Those games would have printed a small "Super Game Boy Game Pak" logo on the box and cartridge. The adaptor could support up to 64 colors for the border, and 12 colors for the screen. Static screens could display all 10 colors.

Super Nintendo version

Super FamiCom version

It is also possible for Super Game Boy games to make use of the SNES hardware for extra effects, as demonstrated in *Contra: The Alien Wars*, *Donkey Kong*, *Kirby's Dream Land 2*, *A Bug's Life*, *Animaniacs* and *Toy Story*; these games had expanded sound when used with the Super Game Boy. *Wario Blast*, the Game Boy version of *Killer Instinct*, and several other titles even allowed the second Super NES controller to be used for two-player action, and the title screen changed to show that these games had a two-player option, rather than a connection status. The original Super Game Boy does not support game link multiplayer because, according to a Nintendo spokesman, a two-player configuration would interfere with the RF signal from the television.

The Game Boy version of *Space Invaders* allowed players to access a Super NES version of the game as well as a coloured version of the Game Boy game.

Some black Game Boy Color cartridge games also have Super Game Boy enhancements, although there isn't any logo indicating this on the cartridge or on the front of the box as there are for original Game Boy releases. Several GBC titles do have a small Super Game Boy compatibility icon located on the back of their packaging, such as for *Dragon Warrior Monsters 2: Cobi's Journey*.

The Super Game Boy actually consists of the same hardware as the Game Boy; inside the cartridge is a separate CPU that processes the games while the Super NES only provided means for user-input, output of graphics to the screen, and the additional coloring, similar to the Atari 5200 version of the Atari 2600 adapter.

The original Super Game Boy is known to play the game program and its audio 2.4% faster than other Game Boy hardware. This is due to the use of the Super NES's clock speed divided by 5, which ends up being 4.295 MHz instead of 4.194 MHz. The timing issue can be rectified by adding an appropriate crystal oscillator to the Super Game Boy and disconnecting the Super NES's clock source.

The Super Game Boy is the successor to Intelligent Systems' Wide Boy 2 (which connected to the FamiCom or NES). One difference between the Wide Boy and the Super Game Boy is that the former did not use any part of the FamiCom/NES other than the video memory. Even the controller (a single Famicom controller) is hardwired directly into the Wide Boy. The Wide Boy would continue running even if the reset button is held down on the Famicom/NES. The Game Boy had twice as many tiles as could fit in the FamiCom/NES's video memory, so the Wide Boy had to refresh the FamiCom/NES's video memory halfway down the screen.

Super Game Boy 2

The Super Game Boy 2 was released exclusively in Japan in 1998. Additions included a link port to allow a user to access two-player mode via the link cable, the green game link LED, and the red power LED indicator, and runs at the exact speed of the Game Boy (the original model runs 2.4% faster than a Game Boy). In addition, it came with eight new default borders, which replaced those in the original model (though the old borders are still accessible via a code); however, it retained the same built-in palettes and coloring tools as on the original model. Contrary to rumors, the system is unable to run Game Boy Color-exclusive games. Also, this version of the SGB does not allow one to change borders in some games that have built-in borders. Some games have features only available through the Super Game Boy 2, such as a special Tetris DX border.

Hori's SGB Commander controller

In Japan, Hori released a special Super Game Boy controller called the SGB Commander. The controller, aside from the 4 Game Boy buttons (A, B, Start and Select), also had 4 Super Game Boy specific buttons which could enable the user to mute the sound, reduce the speed of the game, change the colors and modify the display window. An additional switch is provided to alternate between Super Game Boy mode and regular Super Famicom Mode.

List of Super Game Boy games

On the next pages is a list of Game Boy games that make use of the enhancements, color palettes, or other features of the Super Game Boy. Or, like some of them, only feature a Super Game Boy logo on the box but has none of the features.

Notes

- Some games will have enhanced music tracks and voice samples if played on the Super Game Boy.
- If Tetris DX is played on the Super Game Boy 2 device, a different border will appear.
- Some games have hidden borders only available by inputting a code on the title screen or while playing the game. The games are: Balloon Fight GB, Mario's Picross, Space Invaders (GB), Picross 2, Super Black Bass, Super Black Bass Pocket 2, Tetris 2, Tetris Attack and TNN Outdoor Fishing Champ.
- TNN Outdoor Fishing Champ is missing a border found on the Japanese version's ending due to that ending being cut for the USA release.
- Some games, such as Bomberman Quest, have borders that only show by linking a Super Game Boy 2 with a Game Boy.
- The Game & Watch Gallery series will show a Super NES controller under Mode Select instead of a Game Boy system if played on the Super Game Boy. Also, when playing one of the mini-games in "Classic" mode, the Super Game Boy will display borders around the screen that mimic the original Game & Watch casing designs.
- Some games (mostly Takara fighting games, but a few others) have special two player modes using two Super NES controllers on Super Game Boy. A few of the SGB Bomberman games (such as Wario Blast) allow for four players using a Super Multitap (or any compatible multiplayer adapter) and four controllers.
- Rumble cartridges have their rumble function disabled when played on a Super Game Boy, even if they are not otherwise enhanced, such as in Hole in One Golf or Test Drive Off-Road 3.
- Several Nintendo-published Game Boy games that were released prior to the Super Game Boy are not otherwise enhanced, but do have special default palettes when played on it. Those will be noted in the list.

It's like Game Boy on steroids.

Now play your Game Boy games **in color** on Super NES.

Imagine this. You're playing all your favorite Game Boy® games on a giant 26-inch screen. And **everything's in color--** colors you've chosen yourself.

And even though they're  Game Boy games, you're playing them through your Super NES®.

You're thinking, whoa, these Metroid hatchlings just quadrupled in size and they're purple! Is this really happening?

Yup. It's **Super Game Boy®**. And you don't have to be a super genius to figure it out.

Just put your favorite Game Boy game into the Super Game Boy accessory, stick the Super

Game Boy into your Super NES and **ta-dah!**

The most excitement your TV has had since it got cable.

So now you've got a **whole new game library** for your Super NES for about the price of a single Super NES game! And it's all so huge and in color. What could be cooler?

Uhhh... nothing. Super Game Boy is pretty much the **coolest thing ever**. So get one. And while you're there, pick up new Donkey Kong™, the first Game Boy game to take full advantage of the amazing and mystical powers of Super Game Boy. But don't make Mario yellow. We heard he hates that.

CRANK UP THESE CLASSICS ON SUPER GAME BOY AND THEY BECOME ALL-NEW BATTLES.

Oddities

These pages include a few different Game Boy related oddities.

Gulf War Game Boy

This Nintendo Game Boy belonged to a soldier in the 1990-1991 Gulf War. The Game Boy was damaged when the barracks the soldiers were staying in were bombed. The damaged Game Boy still works and is running Tetris while perpetually plugged in at the Nintendo World Store in New York City.

Smart Boy

This accessory turns a smartphone into a Game Boy console.

The gadget from Hyperkin is currently in pre-order costing \$59.99 with shipments expected to start in December, 2016.

The idea actually originally saw the light of day as an April Fool's joke in 2015 — but it went down so well with technology enthusiasts that the firm has now actually made it.

The Smart Boy is currently only available for Android smartphones and works by sliding in a mobile phone and a separate Game Boy game into two separate slots.

The game from the cartridge then appears on the screen on the phone.

It works with both the standard Game Boy and Game Boy Color cartridges, and features the standard Game Boy setup with the same buttons as on the classic device.

The Hyperkin was on show at the 2016 E3 where it was demonstrated with a Samsung S7 Edge.

Calculator Boy

The calculator Boy is a simple pocket calculator with an original Game Boy design. The front "Game Boy" buttons does not function and is only part of the design.

The calculator is a licensed Nintendo product released in 1993.

Radio Boy

The Radio Boy is similar in design of the Calculator Boy. The Radio Boy is a simple AM FM radio with an original Game Boy design. The Radio Boy use 2 AA batteries and has inputs for headphones.

The Radio Boy is a licensed Nintendo product released in 1992.

Workboy

While Nintendo's Game Boy redefined handheld gaming, other companies looked to turn Nintendo's entertainment device into a productivity gizmo. InfoGenius had a line of organizer, spell check, travel guide, and other assorted game paks for the system that turned it into a semi-inconvenient pre-PDA, but it was Fabtek that wanted to go the extra mile and turn the Game Boy into a proper mobile workstation.

In 1992, Fabtek was planning on releasing the Work Boy, a keyboard peripheral that attached directly to the Game Boy. It would be used with a suite of business software that would turn the Game Boy into a PDA. Users would be able to store banking info, schedule appointments, and auto-dial your telephone (by holding the Game Boy speaker up to the phone's mouthpiece).

Game Boy Music

Game Boy music is a type of chip music produced using a portable gaming device from the Game Boy line of consoles. To produce music of this genre, one needs a Game Boy and a cartridge containing appropriate tracking software, such as Little Sound DJ.

There are several pieces of software available, but most Game Boy musicians use Nanoloop, Little Sound DJ, Pixelh8 Pro Performer or Pixelh8 Music Tech. Other software includes Carillon Editor, Music Box, Pocket Music, the Game Boy Camera among others.

Nanoloop was programmed by Oliver Wittchow, a German art student. The user interface is minimalistic and distinct from conventional musical user interfaces. Little Sound DJ was programmed by Johan Kotlinski, who lives in Stockholm. Little Sound DJ is a type of four-track tracker.

Timeline

In 1997, Oliver Wittchow and Sebastian Burdach started to work on programming music applications for the Game Boy. During three nights, Sebastian Burdach wrote a very simple sequencer in Game Boy BASIC, probably the very first sequencer for the Game Boy, which allows the user to edit loops in real time.

In 1998, the Game Boy Camera was released. Besides incorporating the ability to take photos, the camera also incorporates gaming capabilities. One of these will lead the player to the DJ game, a sequencer known as “Trippy-H”.

In 1998, Oliver Wittchow switched to programming the Game Boy in C. He performed for the first time with his newly written program “Nanoloop” at the “Liquid Sky Club”, Cologne, at a lo-fi contest, which he won. He recorded a 7” single, which was released 1999 on the xxc3 label.

In 1999, Alec Empire released under the project name “Nintendo Teenage Robots” an album titled “We Punk Einheit!”. The music consisted solely of Game Boy sounds, made with the dj program of the Game Boy Camera. Later Alec Empire also used Nanoloop live on stage.

In 1999, “Nanoloop 0.8” was sold on flash cartridges, in Germany only.

In 2000, “Nanoloop 1.0” was sold on ROM cartridges, made in Hong Kong. This version is marketed internationally. It was quite buggy, and was replaced later that year with the more stable version 1.1.

In 2000, the German electronic music duo “Klangstabil”, consisting of Maurizio Blanco and Boris May, released two albums, “Sprite Storage Format” (12” lp), and “Gioco Bambino” (cd), consisting mainly of Game Boy music made with the Game Boy Camera, with some external effects and filtering.

In 2000, Aleksi Eeben (a.k.a. “Heat-beat”, from the Commodore Amiga demoscene) released his program “Carillon”. Although it was not intended for live use, one could nonetheless program one’s own music, and one could (and still can) download it for free.

In 2000, Johan Kotlinski created the program Little Sound DJ. Before that, according to Johan Kotlinski, “it was

just a hack ‘instrumentor.gb’ that I sent to my demo group friends.” At this early stage, lsdj was nowhere near finished. The first versions, which were put on cartridges and sold, came out 2001.

In 2001, Chris McCormick, from Chrism and Fenris, created the program Looper Advance. It is a looper/sequencer for the Game Boy Advance.

In 2002, Jester Interactive created Pocket Music for the Game Boy Color and Game Boy Advance which was published by Rage. They are Sample based sequencers and the Game Boy Advance version has a mild dub of Eminem’s single “My Name Is.”

In 2002, the now defunct label “Disco Bruit” released the various artists compilation “Nanoloop 1.0”. Several in the electronic music scene established artists (like Dat politics, Merzbow, Felix Kubin, etc.) were given nanoloops. Supposedly also Aphex Twin was to contribute, but somehow it didn’t happen.

In 2003, the CD “Boy Playground” was released on the Relax Beat label. Most of the tracks were created using the program Little Sound DJ and the record was gathering the best Game Boy musicians worldwide (Johan Kotlinski, Bit Shifter, Covox, Lo-Bat, Mark DeNardo, Tobiah, The Hardliner, Goto80, Nim, Handheld, Bud Melvin, Adlib Sinner Forks, Dilemma, Keichi Hirao, Puss, Teamtendo).

In 2003, Malcolm McLaren (of Sex Pistols fame) was collaborating with Relax Beat producers Jacques Fantino and Thierry Criscione who initiated him to Chip music during the studio sessions. After listening to the first Game Boy track, Malcolm McLaren’s comment was : “It sounds ugly... but this music is so beautiful !”. Malcolm McLaren was so excited to discover this new genre that he proposed to write a promotional article in Wired for the release of the CD “Boy Playground”. He wrote an article in Wired magazine, claiming Game Boy music (or 8-bit music, or chiptunes in general) to be the new punk rock. This article was very controversial, and McLaren’s effort to create a hype around the new “8-bit punk” was not welcome by very many chipmusicians, and resulted in an open letter by chipmusician gwEm (Gareth Morris). McLaren did arrange a “Fashion Beast” party in Florence, Italy, in 2004. Chinese girl group “Wild Strawberries”, and Game Boy musicians Covox and Lo-bat were playing. Lately it has become a bit silent around McLaren’s “8-bit punk”. In 2005 he designed clothing for kids, seemingly inspired by 8-bit aesthetics.

In 2005 8 Bit Weapon played their songs “Bombs Away” & “Gameboy Rocker” off an old Game Boy using LSDJ on G4’s Attack of the Show live broadcast Episode #5058.

In 2006, the CD “Glitter & Bleep : Joystick Pop” was produced by the Relax Beat label. It features original songs by the greatest talents of the European 8-bit scene. Besides Game Boys also various other 8-bit consoles were used.

In 2007, the cd “8-Bit Operators: The Music of Kraftwerk” was released on the Astralwerks label. It features cover versions of Kraftwerk songs by several prominent chiptune artists. Besides Game Boys also various other 8-bit consoles were used.

The Game Boy music scene is quite small and spread around the world, with musicians creating music in a wide range of styles. Several major signed artists have also been known to use LSDJ and Nanoloop.

In late 2007 Pixelh8 designed music software such as Music Tech for the Nintendo Game Boy which turns the Game Boy into real time synthesizer, whereby the user can design the sound and play notes by using the keys.

In 2008 the Pixelh8 designed Pro Performer for the Nintendo Game Boy Advance and Nintendo DS which was an upgraded version of the Music Tech for Game Boy.

April 15, 2009 Pixelh8 released Pixelh8 Music Tech V2.0, Pro Performer, Drum Tech and Death Ray software free for download from his official website.

In April 2009, Sony Creative Software released “8 Bit Weapon: A Chiptune Odyssey” loop and sample Library. The library contains music loops and samples made by the band using various vintage computers and video game consoles, including the original Nintendo Game Boy.

Popular Mods

By: BenBurge@instructables.com

Below is a list of popular mods for the Game Boy

Backlight

One of the most important mods for long term music writing, Backlights in DMGs, Pockets, and even GBCs have come a long way since they first originated. With a relatively simple install, and next to no space taken, a Backlight is a must have- especially when there's tons of colors to choose from!

Prosound

Probably the most common and easiest of mods for the DMG, Pocket, and Color, the Prosound mod helps fight gain by catching the audio before it runs through the pre-amp. This mod fits many places in the Game Boy, as it only requires an audio jack, and a tad bit of rewiring. Stereo and RCA jacks are most commonly used, but when trying to conserve space, the stereo jack already wired into the gameboy can be rewired to be 'Prosound.'

Under Clock/Over Clock

A bit more simple of an install, over, or under, clocking the gameboy allows users to change the speed at which it runs- but unlike the pitch mod, the clock speed one chooses will not be variable. Users can use just about any ol' crystal for this, and wiring in a switch, to switch between speeds, is possible. This guy won't take up much space, and is a great star if users are a bit worried about the circuitry that goes into the Pitch Mod (because this is mostly internal there's no picture).

Pitch Mod

One of the most neat mods, this little guy works by cutting off the crystal oscillator that normally controls the GameBoy's speed, and replaces it with a signal from a LTC1799 that varies with the voltage supplied from a potentiometer- ergo, users can control the time their Gameboy runs at, therefore controlling the pitch (think over/under-clocking). Although the LTC is nice and tiny, the pot can get pretty big, and although it's common practice to remove the speaker and use that space for the pot, Ben likes the idea of using a slide potentiometer on the side. If users want to be able to enable/disable the Pitch Mod, like in the video, plan on leaving room for a switch.

Biversion/inversion

A huge help in the field of contrast, and an awesome looking mod to boot, Biverting a gameboy gives users the option to switch between an inverted screen, and a normal screen by inverting bits of data before they

reach the screen. A pretty simple mod, only requiring one chip, this is sure to spice up any DMG!

Internal LEDs

Nothing goes better with a clear cased gameboy than some sweet LEDs. A super simple mod, not much space will be needed for this one (users should account for a switch if they plan to add on though).

PS/2 Keyboard

A nice simple mod, with a couple of options: Either connected through the link port, or using an internal PS/2 jack- this mod is a perfect fit for anyone playing live.

Arduinoboy

One of the most interesting mods, the Arduinoboy will give the Gameboy full MIDI in, and MIDI out support. The Arduinoboy also brings with it an array of LEDs that will flash along to the tunes. Although originally designed for external use, many modders have made use of the Arduino Mini/Mini Pro to create an internal Arduinoboy. Taking up quite a bit of space, an internal Arduinoboy has a couple variations, and will be a challenging build for anyone new to electronics.

While designing, it may seem tempting to plan to add ALL THE MODS, users should keep in mind, the space they have to deal with is very minimal. Granted they shouldn't let this limit themselves, but if this is their first build it may not be the worst idea to start small.

This page is a small excerpt taken from the excellent walkthrough by Ben Burge on how to mod the Game Boy.

These pages consist of checklists for your own Game Boy collection. The Checklist are made for you to cross out the games you have. “C” mean the cart. “I” is the manual/information. And “B” is the box.

The Game Boy is region free, so you can actually play games from every region. The only issue would be text based games not covering you language.

The games are listed in three categories: North-America, Europe and Japan. I mostly used the site rfgeneration.com for making these lists.

US GB LIST

The first list is made up by (hopefully) every game released in North-America (NTSC). The NTSC version of a Game Boy game can be easily recognised on the cover by the oval shaped “seal of Nintendo” and the rating system.

For the North American launches, Super Mario Land, Alleyway, Baseball, Tetris and Tennis were featured.

Game Boy from Nintendo.
Picking it up is the **easy** part.

Digital stereo sound.
Personal headphones.
Game link for head to head play.
And at only 5½" x 3½",
anyone can pick up
the **Game Boy** video
games machine, anywhere.
But with a superb range
of addictive games on
interchangeable cartridges
putting it down is a different story.

There's **nowhere** you **can't** play it.

Nintendo

EU GB LIST

This list is made up by (hopefully) every game released in Europe (PAL). The PAL version of a Game Boy game can be easily recognised on the cover by the round shaped “seal of Nintendo” and the rating system.

I used a combination of rfgeneration.com and another list I have lost the link to. rfgeneration.com does not include every region variant of the game, so this list is lacking a bit. But I hope it at least cover every release at a whole.

JP GB LIST

This list is made up by games released in Japan (NYSC-J). The Japanese versions of a Game Boy game can be easily recognised on the completely different game box and Japanese letters.

I used rfgeneration.com to compile this list and hope it include every Japanese release.

The Game Boy first launched in Japan with Super Mario Land, Alleyway, Baseball and Yakuman
